

Ideation Phase

Brainstorm & Idea Prioritization Template

Brainstorming provides an opportunity to explore multiple approaches before selecting the most effective solution. The ideas below were developed for the **Automated Network Request Management** problem and evaluated based on business value, implementation feasibility, automation potential, and suitability for implementation using the ServiceNow platform.

Date	27 July 2026	Team ID	Not Specified
Project Name	Automated Network Request Management	Maximum Marks	4 Marks

Step 1: Select the Problem Statement

Selected Problem: Many organizations still manage network service requests such as VPN access, Wi-Fi access, firewall permissions, email access, and shared drive access manually through emails, spreadsheets, or phone calls. This manual process results in delayed approvals, poor visibility into request status, duplicate requests, inconsistent processing, and increased workload for IT administrators.

Employees often struggle to know the status of their requests, while administrators spend significant time manually assigning requests, sending updates, and maintaining records.

The organization requires a centralized and automated solution that enables users to submit network requests through a single portal, automatically routes requests to the appropriate support teams, tracks request progress, sends notifications, and provides real-time reporting for better operational efficiency.

Step 2: Brainstorm, Idea Listing and Grouping

Category	Idea	ServiceNow Capability
Request Submission	Create a centralized Service Catalog item for submitting network service requests.	Service Catalog
Request Information	Collect request type, device type, access level, business justification, and requested user details.	Catalog Variables
Request Processing	Automatically create a Network Request record after submission.	Flow Designer
Request Routing	Route requests to the appropriate support or network team.	Flow Designer
Approval Management	Automate manager or network administrator approvals before processing requests.	Approval Engine
Task Assignment	Automatically assign tasks to IT support groups based on request type.	Flow Designer
Business Validation	Validate mandatory fields before processing requests.	Catalog UI Policies / Data Policies
Notifications	Send request submission, approval, rejection, and completion notifications automatically.	Notifications
Request Tracking	Maintain complete request history and status for users and administrators.	Custom Table / Reporting
User Experience	Provide a simple and intuitive self-service portal for employees.	Service Portal / Catalog

Step 3: Idea Prioritization

The proposed ideas were evaluated based on four criteria:

- User Impact
- Implementation Feasibility
- Automation Value
- Alignment with ServiceNow Platform

Higher ratings indicate higher priority for implementation.

Priority	Idea	User Impact	Feasibility	Automation	Decision
1	Automated Network Request Submission using Service Catalog	High	High	High	Selected
2	Automatic Record Creation through Flow Designer	High	High	High	Selected
3	Automatic Assignment to Network Support Team	High	High	High	Selected
4	Automated Approval Workflow	High	High	High	Selected
5	Email Notifications for Request Status	High	High	High	Selected
6	Reports and Dashboards for Request Monitoring	Medium	High	Medium	Phase 1 / Extension
7	SLA Monitoring and Escalation	Medium	Medium	Medium	Future Enhancement
8	AI-based Request Categorization	Medium	Medium	Medium	Future Enhancement

Prioritized Solution Concept

The selected solution is a **ServiceNow-based Automated Network Request Management application** that digitizes the complete lifecycle of network service requests.

Employees submit requests through a Service Catalog item by providing the required request details. Flow Designer automatically processes the request, retrieves the submitted catalog variables, creates a Network Request record in the custom table, routes the request to the appropriate support team, initiates approval workflows, sends automated notifications, and continuously tracks the request until completion.

The application eliminates manual request handling, improves transparency, reduces processing time, and enables administrators to manage all network requests efficiently through centralized reports and dashboards.

Recommended MVP Scope

- Service Catalog based Network Access Request Form
- Catalog Variables for collecting request information
- Automatic Network Request Record Creation
- Flow Designer Automation
- Request Routing
- Approval Workflow

- Task Assignment
- Email Notifications
- Request Status Tracking
- Reports
- Dashboards
- Basic Role-Based Access Control (ACLs)
