

Customer Journey Map

Automated Network Request Management

Journey Stage	Employee Goal	Employee Actions	Touchpoint / System	Pain Point	ServiceNow Response	Emotion	Success Metric
1. Need arises	Obtain network access to perform work	Identifies the need for VPN, Wi-Fi, firewall, email, or shared drive access	Service Portal / Catalog	Manual request process through emails or phone calls	Provides a centralized self-service catalog for network requests	Concerned	Time to start request submission
2. Submit Request	Submit a network access request	Opens the Network Access Request catalog item and enters request details	Service Catalog	Forms may be incomplete or incorrect	Guided catalog form with mandatory fields and validation	Focused	Request submission completion rate
3. Validate Request	Ensure request information is accurate	Reviews request type, device type, access level, business justification, and requested user	Catalog Variables & UI Policies	Missing or invalid information delays processing	Validates mandatory fields before submission	Confident	Validation success rate
4. Request Processing	Ensure the request is recorded	Clicks Order Now to submit the request	Flow Designer	Manual record creation is slow and error-prone	Automatically creates a Network Request record in the custom table	Relieved	Request creation time
5. Approval & Assignment	Obtain required approval	Waits for manager or network administrator approval	Approval Engine & Flow Designer	Delays in assigning requests to the correct team	Automatically routes requests to approvers and support groups	Hopeful	Approval turnaround time
6. Request Fulfillment	Receive requested network access	IT team configures the requested access and updates the request status	Network Request Table & Tasks	Lack of visibility into request progress	Tracks request status and task completion in real time	Satisfied	Average request resolution time
7. Completion & Tracking	Verify request completion and view request history	Receives completion notification and checks request status/history	Notifications, Reports & Service Portal	Difficult to track completed requests	Sends automated notifications and maintains searchable request history	Confident	User satisfaction and request tracking accuracy

Key Opportunity: Replace manual network request processing with a ServiceNow-based automated solution that enables employees to submit requests through a centralized Service Catalog, automatically validates request information, creates Network Request records, routes requests for approval, assigns tasks to the appropriate support teams, sends real-time notifications, and provides complete request tracking through reports and dashboards. This improves operational efficiency, reduces processing time, minimizes manual effort, and enhances the overall employee experience.
