Empathize & Discover

Empathy Map Canvas

An empathy map helps understand the needs, behaviors, expectations, and challenges of the users who interact with a service.

For this project, the empathy map focuses on **employees who need network services such as VPN access, Wi-Fi access, firewall permissions, email access, or shared drive access**. The objective is to simplify and automate the request process using ServiceNow instead of relying on emails, phone calls, or manual approvals.

Date	27 July 2026	Team ID	Not Specified
Project Name	Automated Network Request Management	Maximum Marks	4 Marks

Primary User Persona: Metro Passenger

The primary user is an employee who requires secure network services to perform daily work. The employee expects a simple self-service portal to submit requests, track their status, receive timely notifications, and obtain approvals quickly without depending on manual communication.

SAYS • I want to request network access quickly. • I need an easy way to submit my request. • I want to know the status of my request. • I expect my request to reach the correct support team. • I want approval without unnecessary delays. • I need confirmation when my request is completed.	THINKS • Have I selected the correct request type? • Is my business justification sufficient? • Will my request be approved? • How long will it take to receive access? • Will the request reach the correct IT team? • Can I track my request anytime?
DOES • Opens the Service Catalog. • Selects the Network Access Request catalog item. • Enters request details such as request type, device type, access level, business justification, and requested user. • Submits the request. • Tracks request status. • Waits for approval and completion notifications.	FEELS • Frustrated by manual email-based request processes. • Concerned about approval delays. • Confused when request status is not visible. • Relieved after successful request submission. • Confident when notifications are received automatically. • Satisfied when network access is provided on time.

User Pains and Gains

PAINS / CHALLENGES	GAINS / EXPECTATIONS
• Manual email-based request process. • Long approval delays. • No visibility into request status. • Requests sent to the wrong support team. • Repeated follow-ups with IT support. • Manual record creation by administrators. • Difficulty managing multiple requests. • Lack of reporting and analytics.	• Easy self-service request submission. • Faster automated approvals. • Real-time request tracking. • Automatic request routing. • Automated notifications and updates. • Automatic Network Request record creation. • Centralized request management. • Reports and dashboards for monitoring requests.

ServiceNow Solution Context

The proposed solution automates the complete lifecycle of network service requests using ServiceNow.

Employees submit requests through the **Service Catalog**, where they provide information such as request type, device type, access level, business justification, and requested user. **Flow Designer** automatically retrieves the submitted catalog variables, validates the request, creates a **Network Request Record** in the custom table, routes the request to the appropriate approval process, assigns tasks to the relevant IT support team, sends automated notifications, and updates reports and dashboards.

This centralized solution reduces manual effort, improves request visibility, standardizes the approval process, and enhances the overall employee experience.

Key User Needs Identified

1. Simple and user-friendly Network Access Request form.
2. Easy selection of request type, device type, and access level.
3. Automatic validation of mandatory information.
4. Automatic creation of Network Request records.
5. Faster approval workflow.
6. Automatic assignment to the appropriate IT support team.
7. Real-time request status tracking.
8. Automated email notifications.
9. Centralized request management.
10. Reports and dashboards for administrators.
11. Reduced manual effort.
12. Improved operational efficiency.
