

Problem – Solution Fit Canvas

Automated Network Request Management

1. CUSTOMER SEGMENT(S) Employees, Managers, Network Administrators, IT Support Engineers, and System Administrators working within an organization who require or manage network services such as VPN access, Wi-Fi access, firewall permissions, email access, and shared drive access. These users expect a secure, centralized, and efficient system for submitting, approving, processing, and tracking network requests.	2. JOBS-TO-BE-DONE / PROBLEMS Employees need to submit network access requests quickly, provide the required request details, obtain approvals without unnecessary delays, and track the progress of their requests until completion. IT administrators require an automated system that reduces manual work, ensures accurate routing, and maintains complete request records.
3. TRIGGERS An employee needs access to a network service such as VPN, Wi-Fi, firewall, email, or shared drive to perform official work. The employee logs into the Service Portal and submits a Network Access Request instead of sending emails or contacting the IT department manually.	4. EMOTIONS: BEFORE / AFTER Before: Employees feel frustrated due to manual request processes, approval delays, repeated follow-ups, and lack of visibility into request status. After: Employees feel confident and satisfied because requests are submitted through a centralized Service Catalog, processed automatically, approvals are streamlined, notifications are sent in real time, and request status can be tracked easily.
5. AVAILABLE SOLUTIONS Existing approaches include email-based requests, spreadsheets, phone calls, paper forms, or disconnected ticketing systems. These methods often require manual record creation, manual approvals, manual assignment to IT teams, and repeated communication between employees and administrators.	6. CUSTOMER CONSTRAINTS Employees expect quick service but face delays caused by manual processing, missing information, approval bottlenecks, incorrect request routing, and lack of transparency. Administrators also spend significant time creating records, assigning requests, and updating request status manually.
7. BEHAVIOUR Employees identify the required network service, open the Service Catalog, complete the Network Access Request form by selecting the request type, device type, access level, business justification, and requested user, submit the request, monitor its status, and receive notifications after approval and completion..	8. CHANNELS OF BEHAVIOUR Online: ServiceNow Service Portal, Service Catalog, Flow Designer, Email Notifications, Reports, Dashboards, and Self-Service Request Tracking. Offline: Communication with IT support through phone calls, emails, or direct interaction when exceptional situations require manual intervention.

9. PROBLEM ROOT CAUSE

Traditional network request management relies heavily on manual communication, manual approvals, manual task assignment, and disconnected processes. The absence of a centralized workflow leads to processing delays, duplicate requests, inconsistent handling, poor visibility, and increased administrative effort.

10. YOUR SOLUTION

Develop a **ServiceNow-based Automated Network Request Management** application that enables employees to submit network service requests through a centralized Service Catalog. The solution automatically retrieves catalog variables, creates Network Request records, validates request information, routes requests for approval, assigns tasks to the appropriate IT support teams, sends automated notifications, tracks request progress, and provides reports and dashboards for administrators. This workflow improves efficiency, reduces manual effort, accelerates request processing, and enhances the overall user experience.

Purpose / Vision: To provide organizations with a centralized, secure, and automated network request management system that simplifies request submission, automates approvals and task assignment, enables real-time request tracking, reduces manual effort, improves operational efficiency, and delivers a better employee experience through ServiceNow automation.
