The Problem–Solution Fit identifies a real organizational problem and validates that the proposed ServiceNow solution effectively addresses that problem.

For the **Automated Network Request Management** project, the objective is to automate the complete lifecycle of network service requests by replacing manual request handling with a centralized, workflow-driven ServiceNow application. The solution focuses on improving request submission, approval, assignment, tracking, and reporting while reducing manual effort and processing time.

### Problem – Solution Fit

| Area                 | Project-specific fit                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Customer             | Employees, Managers, Network Administrators, IT Support Engineers, and System Administrators who manage or use network services within an organization.                                                                                                                                                                                                                                                                       |
| Problem              | Network service requests such as VPN access, Wi-Fi access, firewall access, email access, and shared drive permissions are often handled manually through emails, phone calls, or spreadsheets, resulting in delays, inconsistent processing, and poor visibility.                                                                                                                                                            |
| Existing behaviour   | Employees submit requests manually and follow up through emails or phone calls. IT administrators manually review requests, assign them to support teams, and update request status.                                                                                                                                                                                                                                          |
| Pain points          | Slow request processing, delayed approvals, manual record management, duplicate requests, poor request tracking, repeated follow-ups, incorrect request assignment, and lack of centralized reporting.                                                                                                                                                                                                                        |
| Root cause           | The request lifecycle is not automated. There is no centralized system that integrates request submission, validation, approvals, assignment, notifications, and tracking into a single workflow.                                                                                                                                                                                                                             |
| Desired outcome      | Enable employees to submit network requests through a centralized Service Catalog, automatically validate request information, create Network Request records, route requests for approval, assign them to the correct IT support teams, send notifications, and provide complete request tracking.                                                                                                                           |
| Problem-solution fit | A ServiceNow-based Automated Network Request Management application directly addresses these challenges by automating the entire request lifecycle using Service Catalog, Flow Designer, Approval Engine, Notifications, Reports, and Dashboards. The solution minimizes manual effort, improves operational efficiency, accelerates request processing, and provides complete visibility into every network service request. |

### Validation Measures

| Measure                   | Expected result                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------|
| Request Submission Time   | Employees can submit network requests quickly through the Service Catalog.                     |
| Automatic Record Creation | A Network Request record is automatically created after request submission.                    |
| Approval Processing Time  | Manager and Network Administrator approvals are completed faster through automated workflows.  |
| Task Assignment           | Requests are automatically assigned to the appropriate IT support group based on request type. |
| Request Tracking          | Employees can monitor the status of their requests in real time.                               |

|                        |                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Notifications          | Automatic email notifications are sent for request submission, approval, rejection, and completion.                                          |
| Operational Efficiency | Manual effort and request processing time are significantly reduced.                                                                         |
| Reporting & Dashboards | Administrators can monitor request volume, approval status, pending requests, and overall system performance through reports and dashboards. |
| User Experience        | Employees experience a simple, transparent, and efficient network request process with improved visibility and faster service delivery.      |
