

Project Design Phase

Proposed Solution Template

Date	27 July 2026	Team ID	<u>Not Specified</u>
Project Name	Automated Network Request Management	Maximum Marks	2 Marks

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Many organizations still manage network service requests such as VPN access, Wi-Fi access, firewall access, email access, and shared drive permissions through emails, phone calls, or spreadsheets. These manual processes lead to delayed approvals, poor request tracking, duplicate requests, incorrect routing, increased administrative effort, and lack of transparency. Employees often struggle to know the status of their requests, while IT administrators spend significant time manually processing and monitoring each request.
2	Idea / Solution description	Develop an Automated Network Request Management application using ServiceNow to automate the complete lifecycle of network service requests. Employees submit requests through a centralized Service Catalog by providing request type, device type, access level, business justification, and requested user details. Flow Designer automatically retrieves the catalog variables, validates the request, creates a Network Request record, routes it for approval, assigns tasks to the appropriate IT support team, sends notifications, and updates reports and dashboards for real-time monitoring.
3	Novelty / Uniqueness	The proposed solution combines Service Catalog , Flow Designer , Approval Engine , Task Assignment , Notifications , Reports , and Dashboards into a single enterprise workflow dedicated to network request management. Unlike manual request processing, the application provides end-to-end automation, centralized request tracking, standardized approvals, automatic routing, and real-time monitoring within one ServiceNow platform.
4	Social Impact / Customer Satisfaction	The solution improves employee productivity by simplifying the process of requesting network services and reducing waiting time. Automated approvals, real-time status tracking, and instant notifications provide greater transparency and convenience. IT administrators benefit from reduced manual work, improved operational efficiency, and standardized request handling, resulting in better service quality and higher customer satisfaction.
5	Business Model (Revenue Model)	The solution can be implemented for enterprises, educational institutions, government organizations, healthcare providers, and other businesses requiring centralized network request management. Revenue opportunities include ServiceNow application development, implementation, customization, workflow automation, system integration, maintenance, technical support, training , and future feature enhancements under annual support contracts.
6	Scalability of the Solution	The application is designed to scale across multiple departments and organizations. Future enhancements may include AI-based request categorization, predictive approval recommendations, SLA management, mobile access, REST API integrations, Microsoft Teams integration, performance analytics, knowledge base integration, virtual agent support, multi-level approvals, advanced reporting, and integration with enterprise identity management systems such as Active Directory or Azure AD.
